

INFO-CAPTURE

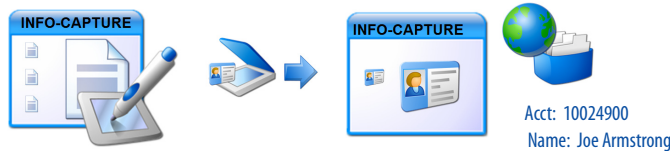

Streamline the new account process by utilizing electronic signatures and automated document archival

INFO-CAPTURE works in conjunction with signature pad hardware and small desktop scanners to capture documents generated from new account origination systems and attach electronic signatures, scan photo Identification cards, and seamlessly archive these documents in OnBase®. Within seconds of the time the new account is set up, signature cards and Photo IDs are available to tellers for verification.

Print documents to **INFO-CAPTURE**, automatically index documents and apply indices globally to all documents.

Apply electronic signatures to documents and scan photo IDs and other documents.

Archive documents, scanned images, photo IDs and other documents into OnBase.

INFO-CAPTURE FEATURES

- Converts documents from windows-based, mainframe and PCL printing systems into TIFF images for placement of electronic signatures
- Electronic signature capture
- Desktop scanning of photo ID cards & other documents (TWAIN driver)
- Automated document indexing
- Seamless archival of documents to OnBase
- Supports free-form signatures, dates and initials
- Document and signature security
- Digital photo capture

How it works

- Accepts "printed" documents directly from new account origination platform products
- Identifies document types and forms and displays the images for viewing
- Extracts index data from the documents to be used as keywords for archival
- Allows electronic signatures to be placed on documents with Topaz Signature Pads
- Scans photo identification cards, corporate resolutions and other documents
- Archives images into OnBase with the associated index values taken from each document
- Keeps the documents together as a transaction set within the new account process
- Once signed electronically, documents may be printed or saved and retrieved for additional signatures at a later time

Benefits

- INFO-PRINT driver requires no custom interface to windows-based or mainframe origination platforms
- Eliminates printing documents for back office scanning and indexing
- Automated document recognition and indexing minimizes or eliminates data entry
- Signature cards and photo IDs are immediately available
- Encryption of electronic signatures ensures a high level of document security
- Keeps the documents together as a transaction set within the new account process
- Paper output is kept to a minimum

INTEGRATION. AUTOMATION. INNOVATION.

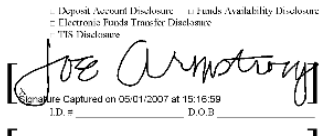

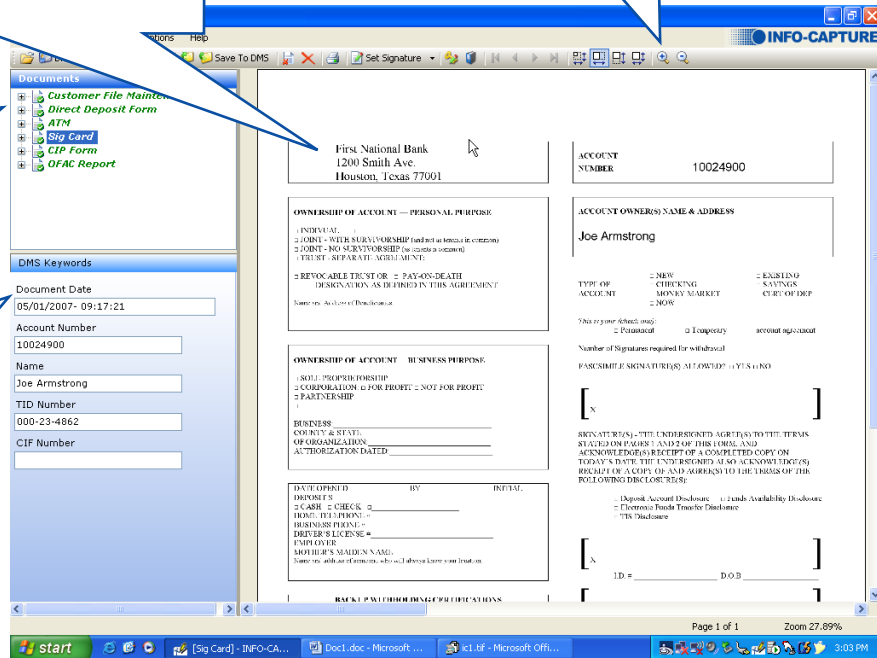

INFO-CAPTURE Facilitates New Account Processing

Instead of printing documents to a physical printer, documents are "printed" to INFO-CAPTURE where they are identified and displayed for viewing.

Standard viewing features include zoom-in and zoom-out functionality.

INFO-CAPTURE identifies the documents generated by the new account platform.

Index data is automatically extracted from the print stream.

The signature is burned into the document image. Document and Signature keys are used for encryption to ensure that neither the document nor the signatures are altered after the document is signed.

A Signature Placement box is placed over the location on the document where an electronic signature is required.

Customers can sign the documents with Topaz electronic signature pads.

The documents can be archived into OnBase using the keywords extracted from documents.
